

VerifyAI — Verbal Consent & Customer Flow Evidence

Toll-Free Verification — Opt-In Type: Verbal (Use Case: Two-Factor Authentication)

1. Verbal Consent Script (word-for-word)

Our representative reads the following to the customer, live on the call, before any text message is sent:

"To verify your identity securely, I'm going to text you a one-time verification link from VerifyAI to confirm you're the account holder. You'll receive one message with a secure link — just tap it to confirm your identity. Message and data rates may apply. Reply STOP to opt out at any time, or HELP for help. Sending that now."

2. How Consent Is Captured

The representative reads the script above to the customer during the live support call, and taps "Send Verification" only after the customer has verbally agreed. No verification message is sent without this spoken confirmation, for every single verification event, with no exceptions.

3. Sample Message Content

"VerifyAI: Tap to confirm your identity: [secure link]. Reply STOP to opt out. Msg & data rates may apply."

4. Customer-Side Verification Screen

Attached below is a mock of the customer-side verification screen shown after the customer verbally agrees to receive a one-time VerifyAI verification text and taps the secure link. Because our toll-free number cannot send live production traffic until verification is approved, this mock reflects the live screen experience.

Note: the verification method shown (PIN, Face ID, or Fingerprint) can vary by business configuration. PIN is enabled by default; biometric options are available depending on the business's plan. This does not change the verbal consent flow described above.

Use Case Match

This verbal opt-in, message content, and customer-side confirmation step directly support the submitted use case — sending one-time verification links to customers during live support calls so they can authenticate their identity without stating sensitive account information aloud.
