

VerifyAI — Verbal Consent Evidence for Live Support Verification

Toll-Free Verification — Opt-In Type: Verbal

What This Use Case Actually Is

VerifyAI sends a one-time verification text with a secure link during a live support interaction, only after the customer verbally agrees, so the customer can confirm they are the account holder. This is not a self-service web sign-up and not a generic passcode login — it is a single spoken exchange between a representative and a customer, on an active call.

1. The Verbal Consent Script — This IS the Opt-In

Nothing is sent to the customer until the exact words below have been spoken and agreed to. This script is the opt-in moment itself:

“To verify your identity securely, I’m going to text you a one-time verification link from VerifyAI to confirm you’re the account holder. You’ll receive one message with a secure link — just tap it to confirm your identity. Message and data rates may apply. Reply STOP to opt out at any time, or HELP for help. Sending that now.”

2. The 3-Step Consent Workflow

1. The representative reads the script above to the customer, live on the call.
2. The customer gives spoken agreement — a clear “yes,” out loud.
3. Only then does the representative tap “Send Verification.” The text is never sent before this point, for any verification event.

3. Sample Message Content

“VerifyAI: Tap to confirm your identity: [secure link]. Reply STOP to opt out. Msg & data rates may apply.”

4. Customer-Side Screen (Supporting Evidence Only — Not the Opt-In)

Important: consent has already been given verbally, per Section 1, before this screen ever appears. This is not where the customer opts in — it is what the customer sees afterward, once they tap the secure link they already agreed to receive.

Note: the verification method shown (PIN, Face ID, or Fingerprint) can vary by business configuration. PIN is enabled by default; biometric options are available depending on the business's plan.
