

VerifyAI — Verbal Consent Evidence for Live Support Verification

Toll-Free Verification — Opt-In Type: Verbal

THE CONSENT MOMENT — COMPLETE PROOF

The exact script the representative reads, live on the call, before anything is sent:

“To verify your identity securely, I’m going to text you a one-time verification link from VerifyAI to confirm you’re the account holder. You’ll receive one message with a secure link — just tap it to confirm your identity. Message and data rates may apply. Reply STOP to opt out at any time, or HELP for help. Sending that now.”

The verification text is sent only after this spoken agreement occurs — never before, for any verification event.

What This Use Case Actually Is

VerifyAI sends a one-time verification text with a secure link during a live support interaction, only after the customer verbally agrees, so the customer can confirm they are the account holder. This is not a self-service web sign-up and not a generic passcode login — it is a single spoken exchange between a representative and a customer, on an active call.

Sample Message Content

“VerifyAI: Tap to confirm your identity: [secure link]. Reply STOP to opt out. Msg & data rates may apply.”

Customer-Side Screen (Supporting Evidence Only — Not the Opt-In)

Consent has already been given verbally, per the card above, before this screen ever appears. This is not where the customer opts in — it is what they see afterward, once they tap the secure link they already agreed to receive.

Note: the verification method shown (PIN, Face ID, or Fingerprint) can vary by business configuration. PIN is enabled by default; biometric options are available depending on the business's plan.
