

VerifyAI — Verbal Opt-In Consent Evidence

Submitted as Opt-In Evidence — Toll-Free Verification (Use Case: Two-Factor Authentication)

Opt-In Method: VerifyAI's automated voice agent obtains real-time verbal consent from the caller before any SMS is sent. No verification text is transmitted unless the script below has first been spoken to and heard by the caller, live, during an active customer support call.

Immediately prior to sending a one-time identity verification link, the agent speaks the following to the caller:

"To verify your identity securely, I'm going to text a one-time verification link to the mobile number on file for your account. You'll receive one message with a secure link — just tap it to confirm you're the account holder. Message and data rates may apply. Reply STOP at any time to opt out of these messages. Sending that now."

Consent Timing: The caller must remain on the line and be actively engaged with a live representative for this script to be spoken; the message is sent only as a direct, real-time result of this verbal exchange, once per verification event.

Sample Message Content Sent to Caller: "VerifyAI: Tap to confirm your identity: [secure link]. Reply STOP to opt out. Msg & data rates may apply."

Use Case Match: This opt-in and message content directly support the submitted use case — sending one-time verification links to customers during live support calls so they can authenticate their identity without stating sensitive account information aloud.
