

# VerifyAI — Verbal Consent Evidence

Toll-Free Verification — Opt-In Type: Verbal (Use Case: Two-Factor Authentication)

## 1. Verbal Consent Script (word-for-word)

Our representative reads the following to the customer, live on the call, before any text message is sent:

*“To verify your identity securely, I’m going to text you a one-time verification link from VerifyAI to confirm you’re the account holder. You’ll receive one message with a secure link — just tap it to confirm your identity. Message and data rates may apply. Reply STOP to opt out at any time, or HELP for help. Sending that now.”*

## 2. How Consent Is Captured

The representative reads the script above to the customer during the live support call. The representative proceeds to tap “Send Verification” in our system only after the customer has verbally agreed to receive the one-time text message. No verification message is sent unless this spoken confirmation occurs first — for every single verification event, with no exceptions.

## 3. Sample Message Content (Supporting Documentation)

The text message the customer receives immediately after giving verbal consent reads exactly as follows, confirming its purpose as a one-time identity verification message:

*“VerifyAI: Tap to confirm your identity: [secure link]. Reply STOP to opt out. Msg & data rates may apply.”*

## Use Case Match

This verbal opt-in and message content directly support the submitted use case — sending one-time verification links to customers during live support calls so they can authenticate their identity without stating sensitive account information aloud.
